Repair of Focal Cartilage Defects With Scaffold-Assisted Autologous Chondrocyte Grafts:

Clinical and Biomechanical Results 48 Month After Transplantation

BioTissue is happy to introduce the most recent publication by Kreuz et al. 2011 currently in press in The American Journal of Sports Medicine.

This brand-new publication presents clinical and biomechanical results at 4-years follow-up in 52 patients treated with BioSeed®-C, BioTissue's autologous chondrocyte graft.

Cartilage regeneration was evaluated on the basis of standard assessment scores as well as MRI. The clinical outcome after transplantation of BioSeed®-C showed excellent and promising results.
